[Quiz Information](#)

Question 1 ✓ Saved

The Mean Square Error or Sum of Squared Error divides the summed loss by 2

- ☐ so that the error is not squared
- ☐ so that the cost function derivatives is straightforward to calculate.
- ☐ as the parameters are less extreme and hence less likely to overfit.
- ☐ so that we can drop 1/2 the parameters and reduce model size

Question 2

The hyperbolic tangent activation function

- ☐ is optimized to reduce overfitting
- ☐ has no known derivative
- ☐ only operates on values -- no weights are required either directly or indirectly
- ☐ doesn't produce outputs in the range [0,1]

Question 3

Training a linear regression model involves optimizing the

- ☐ sigmoid function from dependent to target variables
- ☐ parameters of a function that maps between input and target variables
- ☐ the layers that provide the backbone of a deep network
- ☐ a probabilistic function that maps independent variables to dependent variables
