Quiz Information

Question 4

In Neural Networks, the softmax function

- ☐ is used in the output as it can deal with both positive and negative real valued target values
- ☐ is used in the output layer as it can be computed faster than a max function.
- ☐ is used in output layers for multi-class classification problems where an input can belong to only one of several distinct categories.
- ☐ is frequently used along with the sum of square error loss function.

Question 5

A supervised feed-forward neural network

- ☐ updates its weights to increase the output of the network.
- ☐ does not require labeled data for training.
- ☐ learns functions of the input data that can be fed into an output layer for regression or classification.
- ☐ can use gradient descent training because the network is simple.
